

# Complex numbers

## Definition

- ▶ complex number  $z = a + ib$
- ▶  $i$  the imaginary unit,  $i^2 = -1$
- ▶  $a$  is the real part of  $z$
- ▶  $b$  is the imaginary part of  $z$

- ▶  $\bar{z} = a - ib$  is the complex conjugate of  $z$

$$z\bar{z} = (a+ib)(a-ib) = a^2 - (ib)^2 = a^2 + b^2 \quad \text{is a real number}$$

- ▶ modulus of  $z$

$$|z| = \sqrt{z\bar{z}} = \sqrt{a^2 + b^2}$$

- ▶  $\bar{\bar{z}} = z$  and

$$\operatorname{Re}(z) = \frac{z + \bar{z}}{2}, \quad \operatorname{Im}(z) = \frac{z - \bar{z}}{2i}$$

# Complex numbers: operations

## ► addition

$$z_1 + z_2 = (a_1 + ib_1) + (a_2 + ib_2) = (a_1 + a_2) + i(b_1 + b_2)$$

## ► multiplication

$$z_1 z_2 = (a_1 + ib_1)(a_2 + ib_2) = (a_1 a_2 - b_1 b_2) + i(a_1 b_2 + a_2 b_1)$$

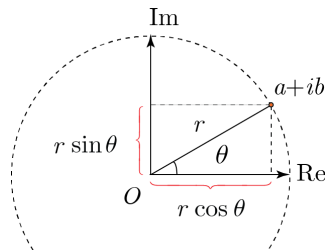

## ► division

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{z_1}{z_2} \frac{\bar{z}_2}{\bar{z}_2} = \frac{a_1 + ib_1}{a_2 + ib_2} \frac{a_2 - ib_2}{a_2 - ib_2} = \frac{(a_1 + ib_1)(a_2 - ib_2)}{a_2^2 + b_2^2} \\ &= \frac{(a_1 a_2 + b_1 b_2) + i(b_1 a_2 - a_1 b_2)}{a_2^2 + b_2^2} \end{aligned}$$

# Complex numbers: polar form

## Definition

- ▶ similar to polar coordinates
- ▶  $r = |z| = \sqrt{a^2 + b^2}$  is the modulus of  $z$
- ▶  $\theta = \arg(z)$  is the argument of  $z$   
( $\tan \theta = a/b$ )

- ▶ Polar representation

$$z = a + ib = r \cos \theta + ir \sin \theta = r (\cos \theta + i \sin \theta) = re^{i\theta}$$

- ▶ Euler's formula

$$\cos \theta + i \sin \theta = e^{i\theta}$$

$$-1 = e^{i\pi}$$

## Complex numbers: Euler's formula

- proof (by Taylor expansion)

$$e^x = 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 + \dots = \sum_{k=0}^{\infty} \frac{1}{k!}x^k$$

- set  $x = i\theta$  and use identities  $i^2 = -1, i^3 = -i, i^4 = 1, \dots$

$$\begin{aligned} e^{i\theta} &= 1 + i\theta + \frac{1}{2!}(i\theta)^2 + \frac{1}{3!}(i\theta)^3 + \frac{1}{4!}(i\theta)^4 + \frac{1}{5!}(i\theta)^5 \dots \\ &= \underbrace{\left(1 - \frac{1}{2}\theta^2 + \frac{1}{4!}\theta^4 + \dots\right)}_{\cos \theta} + i \underbrace{\left(\theta - \frac{1}{3!}\theta^3 + \frac{1}{5!}\theta^5 + \dots\right)}_{\sin \theta} \end{aligned}$$

- exponential representation

$$z = a + ib = e^{\rho+i\theta} = e^{\rho}e^{i\theta} = e^{\rho}(\cos \theta + i \sin \theta)$$

- modulus  $|z| = |e^{\rho}||e^{i\theta}| = e^{\rho}$  since

$$|e^{i\theta}| = |\cos \theta + i \sin \theta| = \sqrt{\cos^2 \theta + \sin^2 \theta} = 1$$

## Complex numbers: expressions for cos and sin

- Let  $z$  be a complex number of unit modulus:

$$z = e^{i\theta} = \cos \theta + i \sin \theta \quad \bar{z} = e^{-i\theta} = \cos \theta - i \sin \theta$$

- Expressions for  $\cos \theta$  and  $\sin \theta$

$$\cos \theta = \operatorname{Re}(e^{i\theta}) = \operatorname{Re}(z) = \frac{z + \bar{z}}{2} = \frac{e^{i\theta} + e^{-i\theta}}{2}$$

$$\sin \theta = \operatorname{Im}(e^{i\theta}) = \operatorname{Im}(z) = \frac{z - \bar{z}}{2i} = \frac{e^{i\theta} - e^{-i\theta}}{2i}$$

- Recall that hyperbolic sine and cosine are defined as

$$\cosh x = \frac{e^x + e^{-x}}{2} \quad \sinh x = \frac{e^x - e^{-x}}{2}$$

- Then

$$\cos \theta = \cosh(i\theta) \quad \sin \theta = \frac{\sinh(i\theta)}{i} = -i \sinh(i\theta)$$

## Complex numbers: computation of some integrals

- Compute

$$\int e^{px} \cos qx \, dx$$

without integrating by parts ( $p$  and  $q$  are real numbers)

- Note that  $\cos qx = \operatorname{Re} \{e^{iqx}\}$ . Therefore

$$\begin{aligned} \int e^{px} \cos qx \, dx &= \int e^{px} \operatorname{Re} \{e^{iqx}\} \, dx = \operatorname{Re} \left\{ \int e^{(p+iq)x} \, dx \right\} = \\ \operatorname{Re} \left\{ \frac{e^{(p+iq)x}}{p+iq} \right\} &= \operatorname{Re} \left\{ \frac{p-iq}{p-iq} \frac{e^{(p+iq)x}}{p+iq} \right\} = \operatorname{Re} \left\{ \frac{(p-iq) e^{(p+iq)x}}{p^2+q^2} \right\} = \\ \frac{e^{px}}{p^2+q^2} \operatorname{Re} \{(p-iq)e^{iqx}\} &= \frac{e^{px}}{p^2+q^2} \operatorname{Re} \{(p-iq)(\cos qx + i \sin qx)\} = \\ \frac{e^{px}}{p^2+q^2} \operatorname{Re} \{(p \cos qx + q \sin qx) &+ i(p \sin qx - q \cos qx)\} = \end{aligned}$$

$$\frac{e^{px}(p \cos qx + q \sin qx)}{p^2 + q^2}$$

## Complex numbers: computation of some integrals

- Compute

$$\int e^{px} \sin qx \, dx$$

without integrating by parts ( $p$  and  $q$  are real numbers)

- Note that  $\sin qx = \operatorname{Im} \{e^{iqx}\}$ . Therefore

$$\begin{aligned} \int e^{px} \sin qx \, dx &= \int e^{px} \operatorname{Im} \{e^{iqx}\} \, dx = \operatorname{Im} \left\{ \int e^{(p+iq)x} \, dx \right\} = \\ \operatorname{Im} \left\{ \frac{e^{(p+iq)x}}{p+iq} \right\} &= \operatorname{Im} \left\{ \frac{p-iq}{p-iq} \frac{e^{(p+iq)x}}{p+iq} \right\} = \operatorname{Im} \left\{ \frac{(p-iq) e^{(p+iq)x}}{p^2+q^2} \right\} = \\ \frac{e^{px}}{p^2+q^2} \operatorname{Im} \{(p-iq)e^{iqx}\} &= \frac{e^{px}}{p^2+q^2} \operatorname{Im} \{(p-iq)(\cos qx + i \sin qx)\} = \\ \frac{e^{px}}{p^2+q^2} \operatorname{Im} \{(p \cos qx + q \sin qx) &+ i(p \sin qx - q \cos qx)\} = \end{aligned}$$

$$\frac{e^{px}(p \sin qx - q \cos qx)}{p^2 + q^2}$$

# Complex numbers: computation of some derivatives

- Compute

$$\frac{d^n}{dx^n} (e^{px} \cos qx)$$

where  $p$  and  $q$  are real numbers, and  $n$  is integer

- Note that  $\cos qx = \operatorname{Re} \{e^{iqx}\}$ . Therefore

$$\begin{aligned} \frac{d^n}{dx^n} (e^{px} \cos qx) &= \frac{d^n}{dx^n} (e^{px} \operatorname{Re} \{e^{iqx}\}) = \operatorname{Re} \left\{ \frac{d^n}{dx^n} (e^{(p+iq)x}) \right\} = \\ &= \operatorname{Re} \left\{ (p+iq)^n e^{(p+iq)x} \right\} = e^{px} \operatorname{Re} \{ (p+iq)^n e^{iqx} \} \end{aligned}$$

- Define  $\varphi$  such that  $\cos \varphi = \frac{p}{\sqrt{p^2+q^2}}$  and  $\sin \varphi = \frac{q}{\sqrt{p^2+q^2}}$ .

$$\text{Then } p+iq = \sqrt{p^2+q^2} (\cos \varphi + i \sin \varphi) = (p^2+q^2)^{\frac{1}{2}} e^{i\varphi}$$

$$\implies \frac{d^n}{dx^n} (e^{px} \cos qx) = e^{px} \operatorname{Re} \left\{ (p^2+q^2)^{\frac{n}{2}} e^{in\varphi} e^{iqx} \right\} =$$

$$e^{px} (p^2+q^2)^{\frac{n}{2}} \operatorname{Re} \left\{ e^{i(n\varphi+qx)} \right\} = e^{px} (p^2+q^2)^{\frac{n}{2}} \cos(n\varphi+qx)$$

# Complex numbers: computation of some derivatives

- Compute

$$\frac{d^n}{dx^n} (e^{px} \sin qx)$$

where  $p$  and  $q$  are real numbers, and  $n$  is integer

- Note that  $\sin qx = \operatorname{Im} \{e^{iqx}\}$ . Therefore

$$\begin{aligned} \frac{d^n}{dx^n} (e^{px} \sin qx) &= \frac{d^n}{dx^n} (e^{px} \operatorname{Im} \{e^{iqx}\}) = \operatorname{Im} \left\{ \frac{d^n}{dx^n} (e^{(p+iq)x}) \right\} = \\ &= \operatorname{Im} \left\{ (p+iq)^n e^{(p+iq)x} \right\} = e^{px} \operatorname{Im} \{ (p+iq)^n e^{iqx} \} \end{aligned}$$

- Define  $\varphi$  such that  $\cos \varphi = \frac{p}{\sqrt{p^2+q^2}}$  and  $\sin \varphi = \frac{q}{\sqrt{p^2+q^2}}$ .

$$\text{Then } p+iq = \sqrt{p^2+q^2} (\cos \varphi + i \sin \varphi) = (p^2+q^2)^{\frac{1}{2}} e^{i\varphi}$$

$$\implies \frac{d^n}{dx^n} (e^{px} \sin qx) = e^{px} \operatorname{Im} \left\{ (p^2+q^2)^{\frac{n}{2}} e^{in\varphi} e^{iqx} \right\} =$$

$$e^{px} (p^2+q^2)^{\frac{n}{2}} \operatorname{Im} \left\{ e^{i(n\varphi+qx)} \right\} = e^{px} (p^2+q^2)^{\frac{n}{2}} \sin(n\varphi+qx)$$

# Complex numbers: computation of some derivatives

- We have defined

$$\frac{d^n}{dx^n} (e^{px} \sin qx) = e^{px} (p^2 + q^2)^{\frac{n}{2}} \sin(n\varphi + qx)$$

$$\frac{d^n}{dx^n} (e^{px} \cos qx) = e^{px} (p^2 + q^2)^{\frac{n}{2}} \cos(n\varphi + qx)$$

- Example:  $p = 4, q = 3 \implies \sqrt{p^2 + q^2} = 5$  and  $\tan \varphi = 3/4$

$$\frac{d^n}{dx^n} (e^{4x} \sin 3x) = 5^n e^{4x} \sin(3x + n \arctan(3/4))$$

- Example:  $p = 1, q = 1 \implies \sqrt{p^2 + q^2} = \sqrt{2}$  and  $\tan \varphi = 1$

$$\frac{d^n}{dx^n} (e^x \cos x) = (\sqrt{2})^n e^x \cos(x + n\pi/4)$$
